

River Crossing #11

1

Three lions and 3 buffalo are trying to cross a river infested with hippos and crocodiles.

2

There is a raft that can carry any two animals (max) at a time per crossing

3

Any of the animals can row the oar, and one animal can cross on its own.

4

The buffalo can hold their own when things are even, but can never be outnumbered by the lions on either side of the river.

5

How can all six animals get across so that the buffalo are never outnumbered on either side by the lions??
